

Lockout/Tagout (LOTO) Management System

Zoe Zhang, Mucteba Ekizoglu, Sithranjan Suresh, Vikashini Suresh, Md Abrar Al Zabir

In Scope

- The lock/unlock button: a worker taps "lock this machine" before they start working on it, and taps "unlock" when they're done and it's safe again.
- A live status dashboard: This is to see which ones are locked and which ones are unlocked
- Log: A history log of every time someone locked or unlocked
- User authentication and role-based access control: workers and supervisors log in with credentials, and the system verifies identity and restricts who is allowed to lock/release each equipment.
- Audit and compliance reporting: a screen where supervisors can view, filter, and export lockout history for safety inspections and compliance records.

Out of Scope

- Physical hardware: The system won't communicate with actual hardware
- Deployment: Scope stays to a web-based dashboard
- Notifications: the system won't send SMS, email, or push alerts to users' personal devices. Status alerts will only appear inside the system as an app banner or indicator on the dashboard, not through outside channels.
